Question 1

A simple electric circuit is a closed path which allows current to flow. The battery gives the potential difference. When the switch is closed the current flows through the bulb, and when it is open no current flows.

In my circuit, the battery, switch, resistor, bulb and the amether are all joined one after another in series. The amether is in series, because it measures the current. The voltmeter is also connected in series with the bulb to measure its voltage.

If the resistance is increased, then the current also increases, because a bigger resistance pushes more current.

Question 2

Technology has changed the way studnets learn today. In my opinion, technology makes learning much easier and better because information which was very hard to find earlier is now available in a few seconds.

A student who does not understand a topic in class can watch a video at home and understand it properly. For example, when I could not understand the water cycle in class, I watched two videos and after that I understood the whole topic.

Technology also saves time because students do not have to search in many books, they get all the informations immediately and can spend that time on practice and revision which improves their knowledge and their marks also improve a lot and this is why every school should give tablets to all students.

Question 3

The table shows the demand and supply at different prices. I have drawn the demmand curve and the suply curve. I have taken the price on the horizontal axis and the quantity on the vertical axis.

The two curves cut each other at the price of Rs. 40 and the quantity of 40 units, and this point is the equilibrium of the market.

When the price is below the equilibrium price the quantity demanded becomes more than the quantity supplied, so there is a shortage and the price starts rising. When the price is above the equilibrium the quantity supplied becomes more than the quantity demanded, so there is a surplus and the price starts falling.

If the cost of production increases, the supply curve shifts to the right side. Because of this the new equilibrium will be at a lower price and a higher quantity.
